EXPERIENCE

ManageXR **San Francisco, CA**
Software Engineer II (Fullstack) *August 2024 - Present*

- Deliver cross-stack platform support for new hardware (e.g., Galaxy XR, PICO SWAN), coordinating changes across Android + backend services + web console (model/branding, device identification, runtime/config compatibility) to make onboarding reliable in production
- Reworked device presence (Firebase Realtime Database onDisconnect, Cloud Function triggers, sweep job), fixing online/offline status on 2,652 devices across 362 orgs; verified with Node audit tooling
- Co-led offline USB updates across 4 repos (React console, NestJS API, Kotlin Android app, Unity Home Screen), allowing customers to generate an integrity-checked update package and install it on headsets with no network; documented the security model and set the compatibility boundaries
- Authored the tech design for on-device subscription enforcement (Stripe-driven resolver, Android app enforcement, Home Screen inactive state); used payment data to trigger only on cancellation
- Planned and built remote file delete and download for headsets: React/MUI, NestJS commands with signed URLs, Kotlin handlers with folder zip and restart recovery
- Own core device-management features in the Android device-management (MDM) agent (Kotlin/Java), shipping end-to-end workflows spanning enrollment/provisioning, firmware/OTA, content sync/downloads, and status reporting; also handle releases, on-call, and Sentry/Crashlytics triage

Stanford School of Medicine (Monje, Huguenard, Knowles Labs) **Stanford Medical School, CA**
Researcher *Fall 2019 - Winter 2023*

- Co-authored *Nature Neuroscience* (2022); contributed EEG coherence analyses and publication figures
- Built MATLAB EEG analysis tooling (annotation, coherence metrics, figures) and, as first Knowles Lab member, a remote workstation + onboarding materials so summer fellows could work independently

PROJECTS

Timeback: *Bypass-resistant iPhone screen time limits, enforced from a Mac* **Founder**

- Launched a paid macOS app (Go, React/TypeScript) that supervises iPhones over USB and installs restriction profiles the phone can't remove, closing Screen Time API bypasses
- Built it solo: iPhone communication over USB via Apple's backup and profile-install protocols, a licensing backend (Node/Postgres) with signed offline licenses, Paddle billing, and notarized auto-updates

Moment: *Social camera where friends capture one moment from every angle* **TestFlight beta**

- Built an iOS app (SwiftUI) where nearby phones connect peer-to-peer, fire their cameras in sync, and exchange photos offline with integrity checks; Fastify/Postgres backend with S3 uploads; 40+ beta testers

Light it up: *Predicting Song Features to Motivate Lighting Choice* **(Best Project Award - top 3%)** **CS 229**

- Built a real-time model to predict pitch/timbre features from live music to drive lighting selection; benchmarked RNN vs baselines (FCNN, logistic regression) and explored genre clustering with K-means

EDUCATION

Stanford University **Stanford, CA**
M.S., Computer Science (Artificial Intelligence) *June 2023*
B.S., Biology; Minor, Classics *June 2023*
Teaching Assistant, CS 279: Structure and Organization of Biomolecules and Cells *Fall 2022*

SKILLS

Languages: Kotlin, Java, TypeScript, Swift, Go, C#, Python, MATLAB, C++, SQL
Frameworks/Platforms: Android, iOS (SwiftUI), Unity, React, Node/NestJS
Tools: Git, CI/CD, Sentry/Crashlytics, Claude Code, Codex, agent-deck (agentic development workflows)
